

AMENDMENTS TO THE CLAIMS

1-8 (canceled)

9 (previously presented): The process of maintaining the channel capacity of a RAID system having storage array controllers which control direct access storage devices (DASD) and which generate a binary signal termed a heartbeat when the storage array controllers are operational when an active storage array controller fails comprising the steps of:

- a. ceasing the emission of the heartbeat by a defective active storage array controller,
- b. detecting the cessation of the heartbeat by a defective active storage array controller and emission of an activation signal by a reporter active storage array controller,
- c. detecting the activation signal by a passive storage array controller and assuming the identity of the defective active storage array controller by the passive storage array controller,
- d. identifying the DASD of the defective storage array controller by the passive storage controller using a table on each DASD,
- e. assuming control of the DASD of the defective storage array controller by the passive storage controller.

10 (previously presented): The method of claim 9 further comprising after step e:

- f. emitting a defective storage array controller signal by the reporter storage array controller or the passive storage array controller.

11-14 (canceled)
